Contents

- What is ambience and how do you record it?
 - The 3 ambience layers
 - Microphone placement for the 3 ambience layers
 - Making decisions:
Layer mix, tonmeister taste and practical requirements
- How do the techniques differ in practice?
 - M/S, X/Y, ORTF, A/B, Double M/S, Double M/S with Shotgun, IRT-Cross, ORTF Surround, Theile trapezoid, Hamasaki Square, 5 cardioids, Decca-Tree, ...
- These findings do not only apply to Ambience!

Signal type

Room signal properties

1

- diffuse
- location-independent
- not localized
- Room information

2

- discrete
- location-independent
- localized, but the location is arbitrary
- Info on position of the source in the room

3

- discrete
- location-dependent
- localized
- Source information

What is ambience?

Signal type

Microphone signal properties

1

- Uncorrelated signals
- Balanced energy distribution

2

- Correlated signals
- Balanced directional distribution

3

- Correlated signals
- Balanced directional distribution
- Real or realistic directional imaging

What is ambience?

Possible microphone setup:

Microphone signal properties

1

- Uncorrelated signals
- Balanced energy distribution

2

- Correlated signals
- Balanced directional distribution

3

- Correlated signals
- Balanced directional distribution
- Real or realistic directional imaging

What is ambience?

Microphone geometry for recording diffuse sound:

- Uncorrelated signals
- Balanced energy distribution

Diffuse sound in the recording room → diffuse sound in the reproduction room

Ambience components: diffuse sound

Microphone geometry for recording diffuse sound:

- Uncorrelated signals
- Balanced energy distribution

Diffuse sound in the recording room → diffuse sound in the reproduction room

Ambience components: diffuse sound

Microphone geometry for recording diffuse sound:

- Uncorrelated signals
- Balanced energy distribution

Diffuse sound in the recording room → diffuse sound in the reproduction room

→ Each channel records a different diffuse signal

→ The channels are decorrelated regarding the the diffuse field

Microphone geometry for recording diffuse sound:

- The larger the distance, the more independent the signals

- The larger the directivity, the more independent the signals

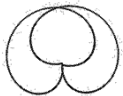

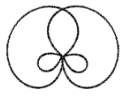

- The larger the opening angle, the more independent the signals

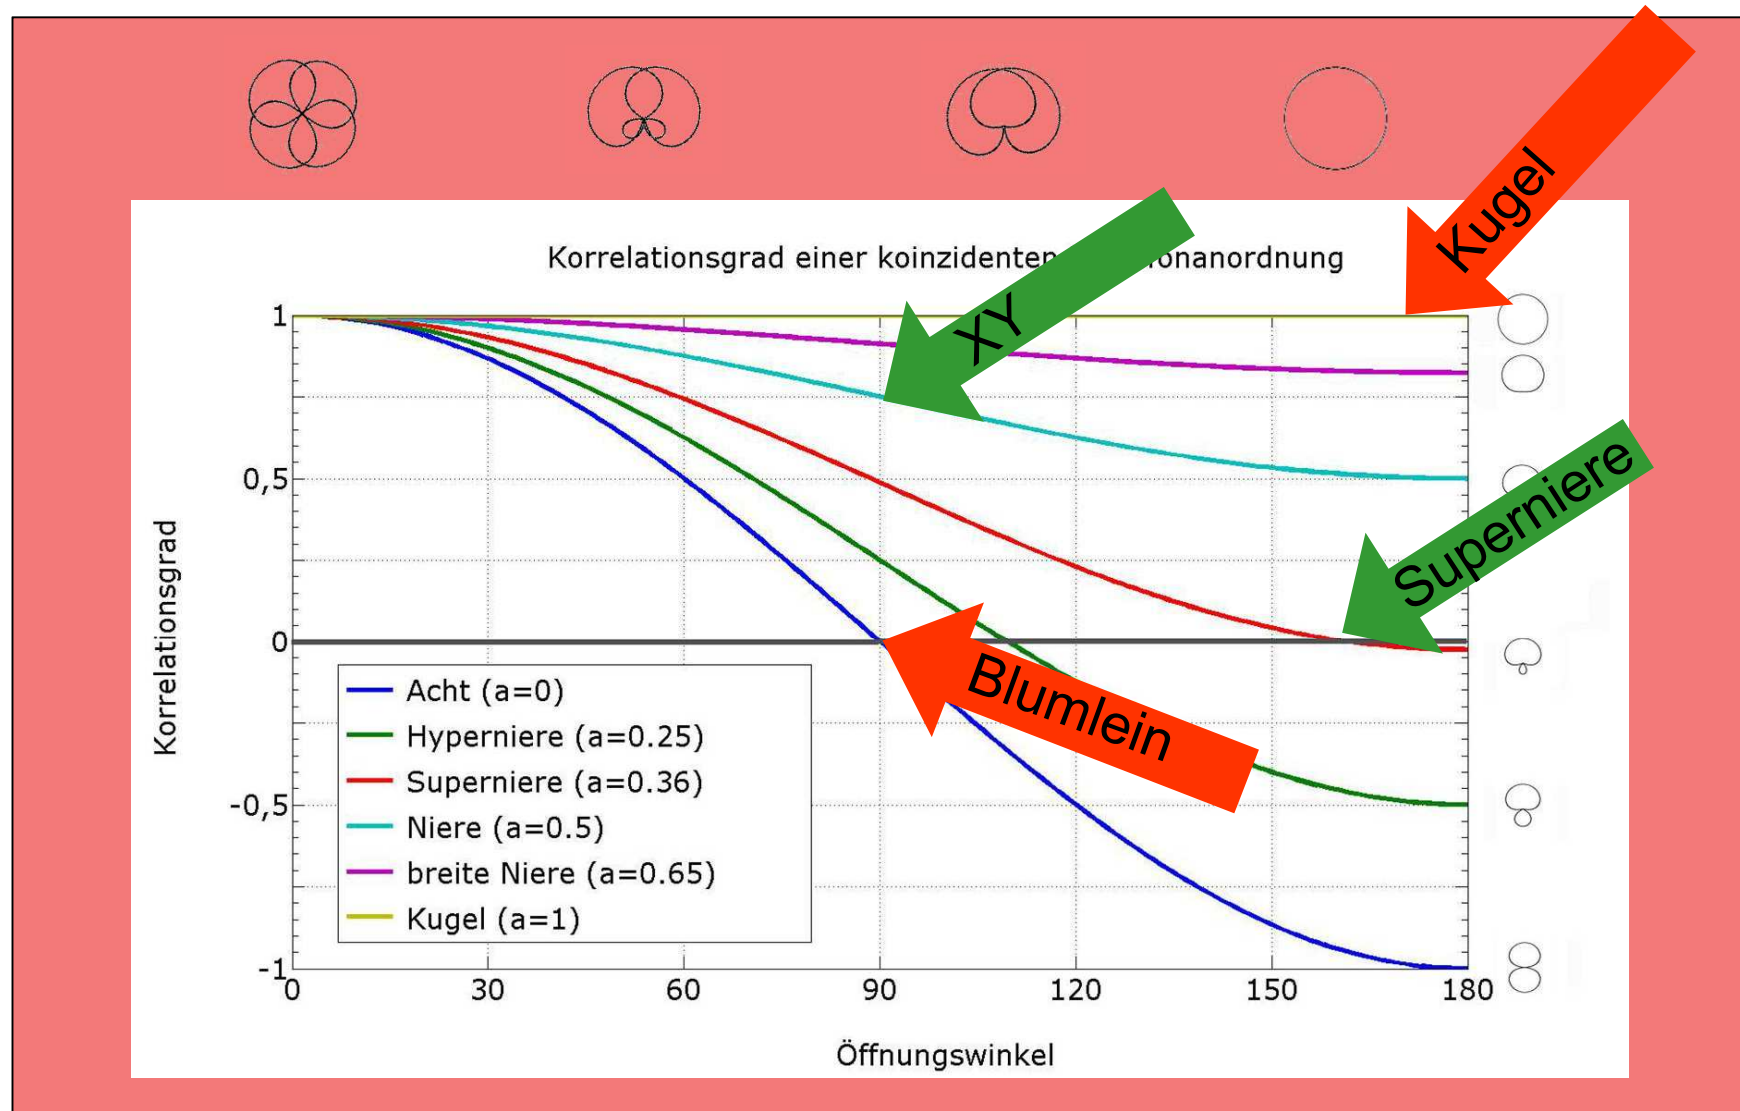

Diffuse field correlation (DFC)

- is dependent on the distance, angle and directivity
- is dependent on the frequency (wave length)

Setup	XY, 90°, Cardioids	XY, 120°, Super-cardioids	Blumlein, 90°, Figure-8
DFC	0.75	0.23	0
			

Diffuse field correlation (DFC): coincident setups

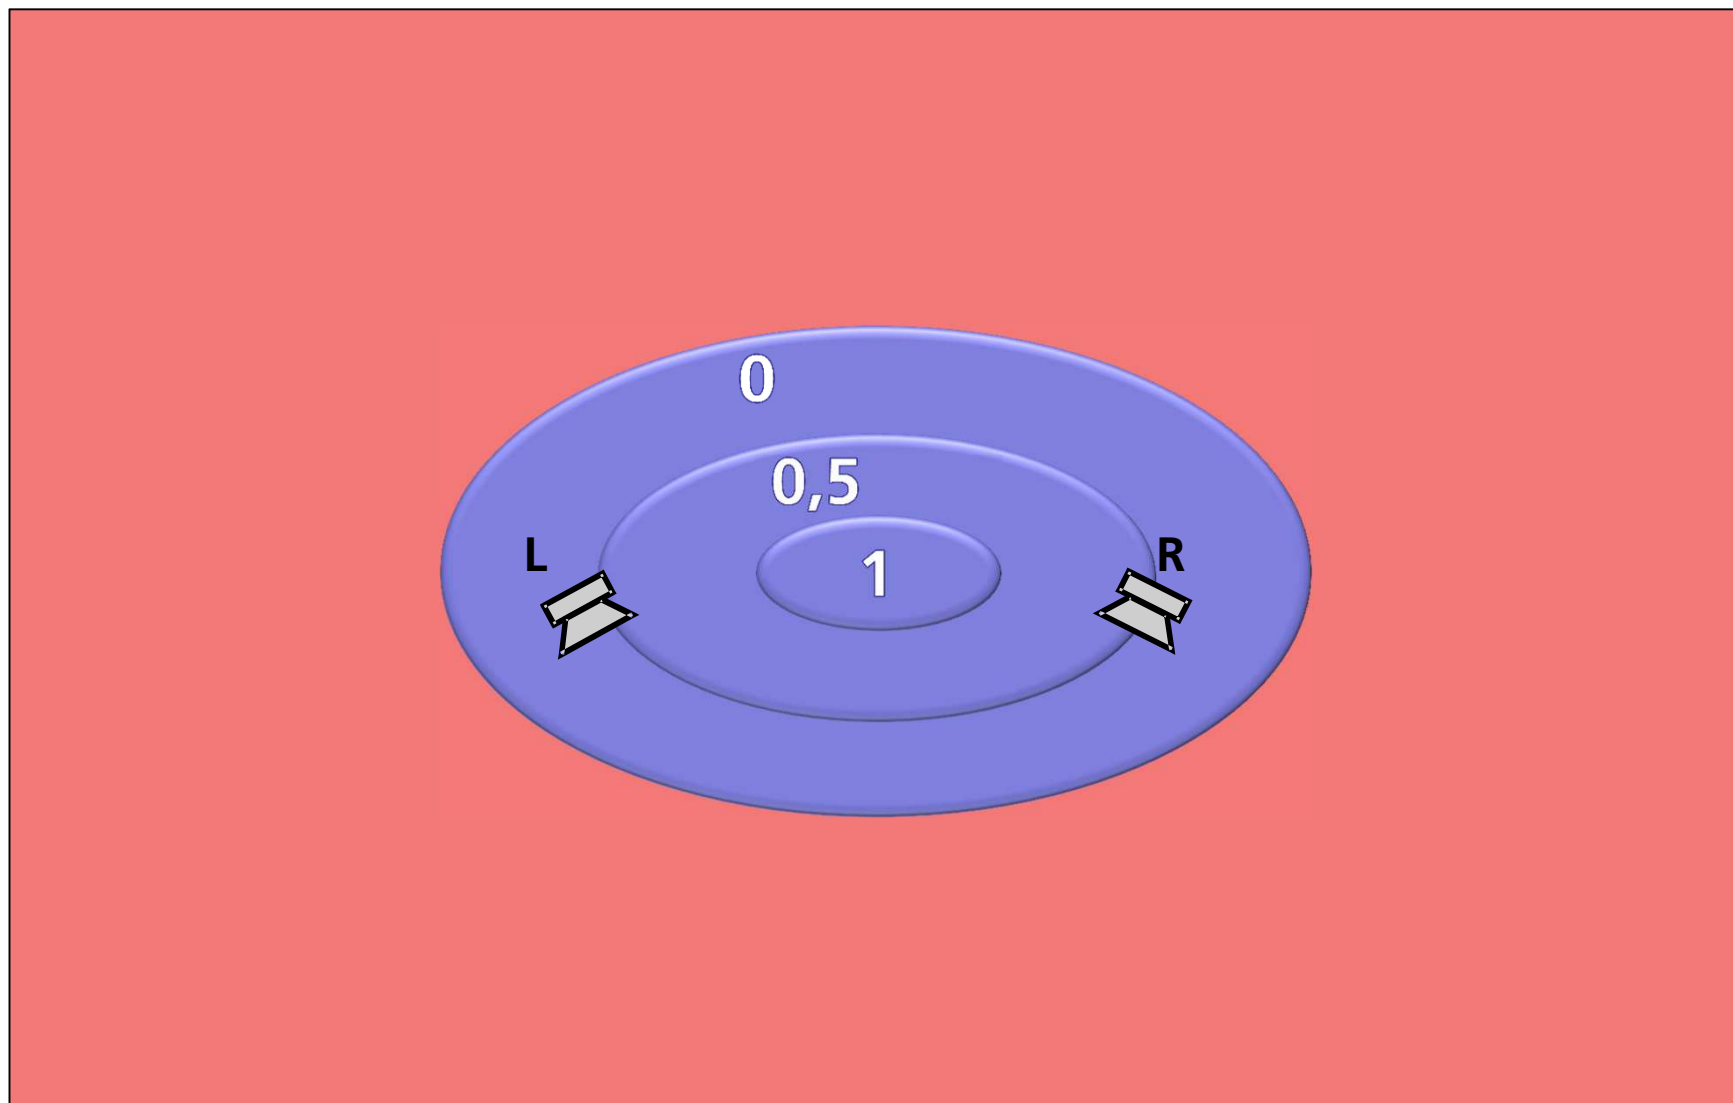

Diffuse field correlation (DFC): non-coincident setups

from: [Riekehof et al., TMT 2010]

Ambience components: diffuse sound

Diffuse field correlation (DFC): determines the perceived width

Ambience components: diffuse sound

DFI-Predictor: Prediction of the perceived width

Ambience components: diffuse sound

Signal type

Microphone signal properties

1

- Uncorrelated signals
- Balanced energy distribution

2

- Correlated signals
- Balanced directional distribution

3

- Correlated signals
- Balanced directional distribution
- Real or realistic directional imaging

What is ambience?

Early Reflections, Discrete Sounds (spread)

- Correlated signals
- Balanced directional distribution

- A discrete early reflection or a certain sound should be reproduced as a phantom source
- The sources should be distributed homogeneously
- The localisation curve doesn't have to be linear:
This means that e.g. channel swapping, large A/B or non-symmetrical setups are an option

Possible microphone setup:

Microphone signal properties

1

- Uncorrelated signals
- Balanced energy distribution

2

- Correlated signals
- Balanced directional distribution

3

- Correlated signals
- Balanced directional distribution
- Real or realistic directional imaging

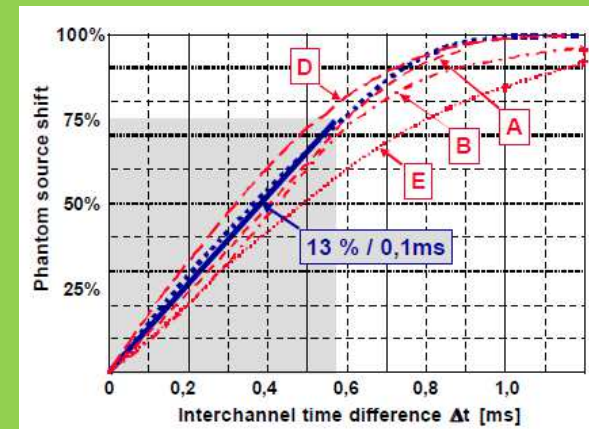

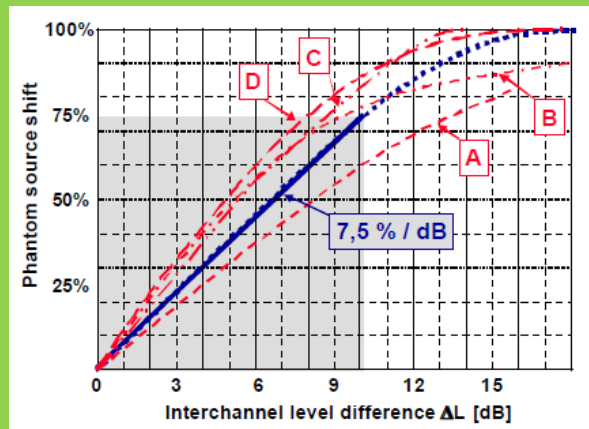

What is ambience?

Directional Imaging

- Correlated signals
- Balanced directional distribution
- Real or realistic directional imaging

- Directional Imaging
 - is dependent on the spacing, angle and directivity patterns

Directional Imaging

- Correlated signals
- Balanced directional distribution
- Real or realistic directional imaging

- Directional Imaging
 - is dependent on the spacing, angle and directivity patterns

... more than 2 signals

- The correlation between each channel pair is important

- Crosstalk = the same signal on more than 2 channels leads to blur and comb filtering

Bei mehr als 2 Signalen

Signal type

Microphone signal properties

1

- Uncorrelated signals
- Balanced energy distribution

2

- Correlated signals
- Balanced directional distribution

3

- Correlated signals
- Balanced directional distribution
- Real or realistic directional imaging

What is ambience?

Choice of the setup: 3 Steps

Step 1. Ambience layer mix: what is my ambience composed of?

Ambience layer mix	Example	Possible microphone setup for 5.1 Surround
1 + 2 (with Center)	Film ambience without discrete noise	5 Omnis
1 + 2 (without Center)	Conzert hall ambience	Hamasaki Square
1 + 2 + 3 (without Center)	Stadium ambience for Sports	ORTF Surround
1 + 2 + 3 (with Center)	Documentary ambience with discrete sources	5 wide cardioids
1 + 2 + 3 (3 only in front)	Orchestra in the concert hall	OCT Surround, OCT + Hamasaki
2 + 3	Dry outside ambience	Double M/S, ORTF Surround
3	Dry radio drama recording in the studio	Double M/S

Choice of the setup: 3 Steps

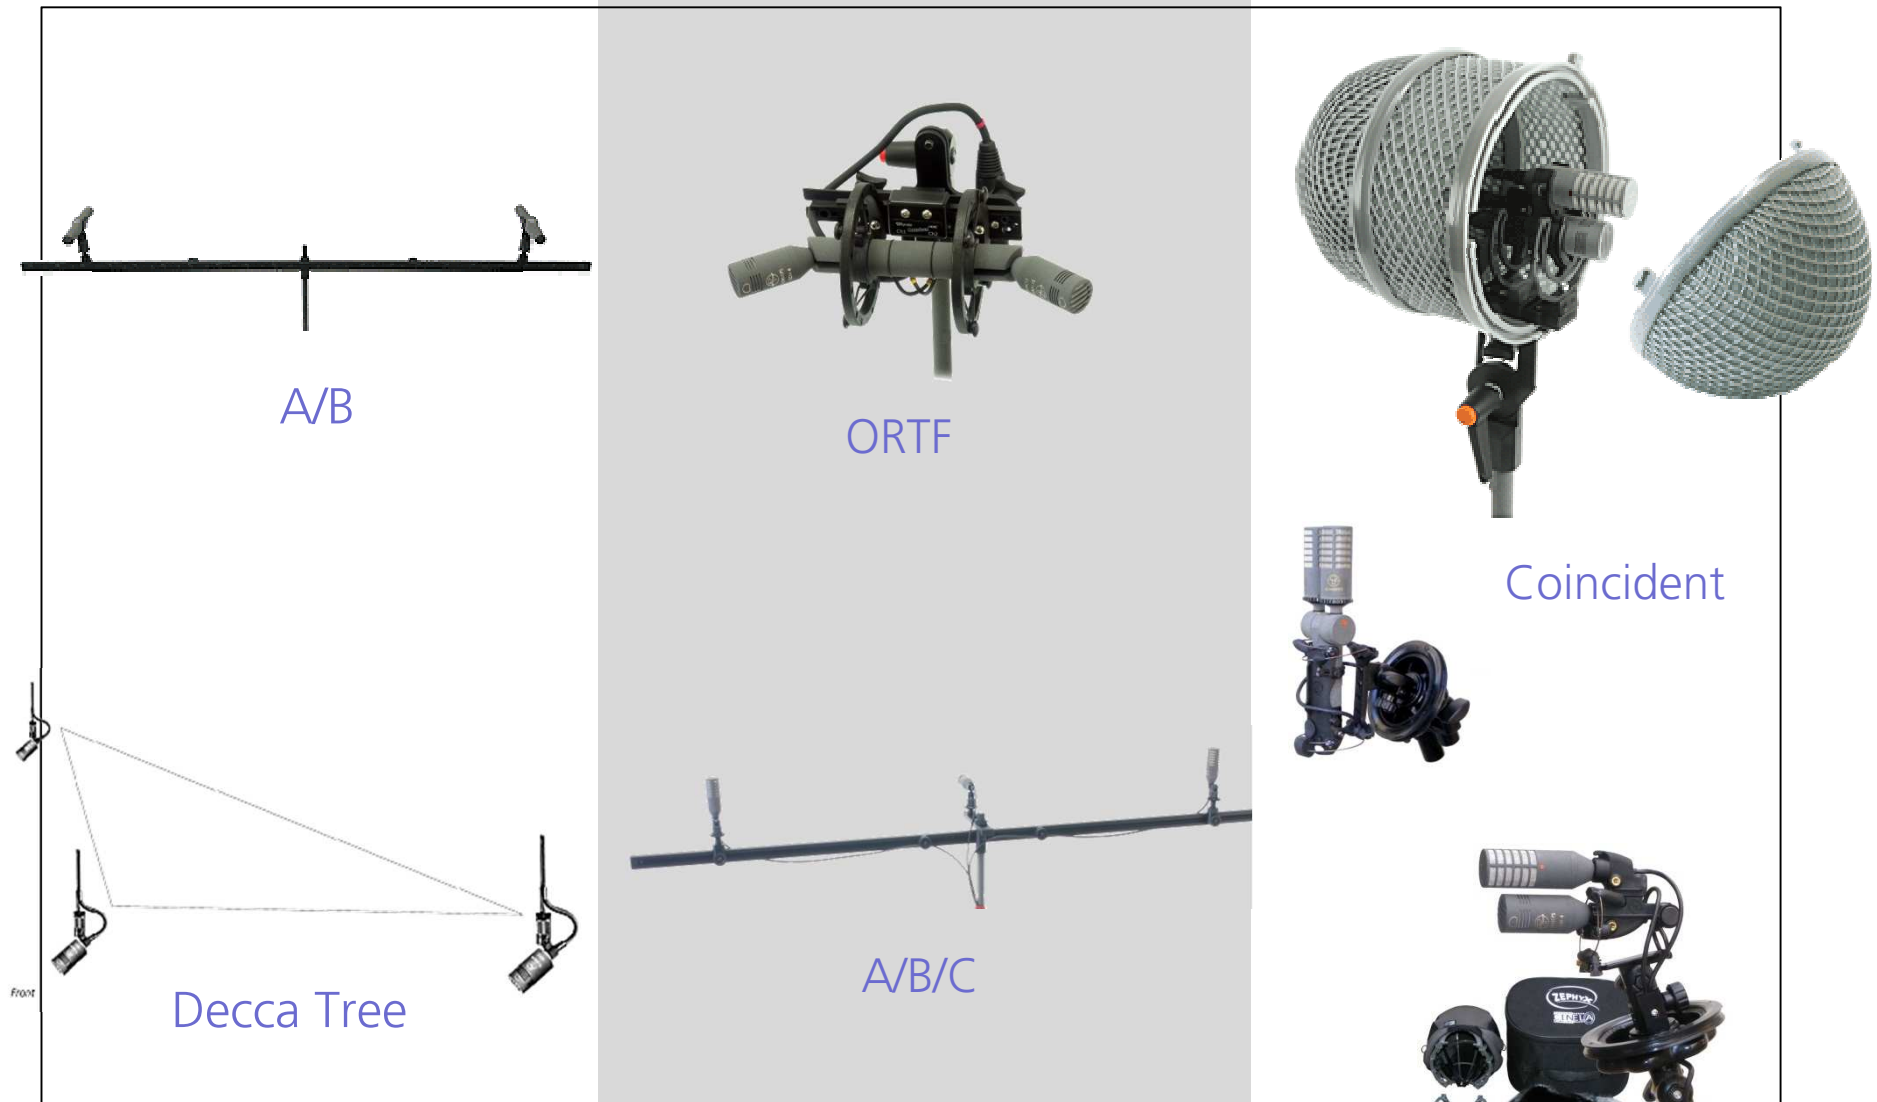

Step 2. The individual taste of the tonmeister and his priorities:

- Choise of the **directivity pattern** and the **microphone type**
- Relative weight of **sound colour, depth, immersion, room impression, directional imaging, naturalness, stability**, etc.

Step 3. Practical Aspects

- **Size, suspension, windshield, flexibility, ease of use, simplicity, price, postpro-options**, etc.

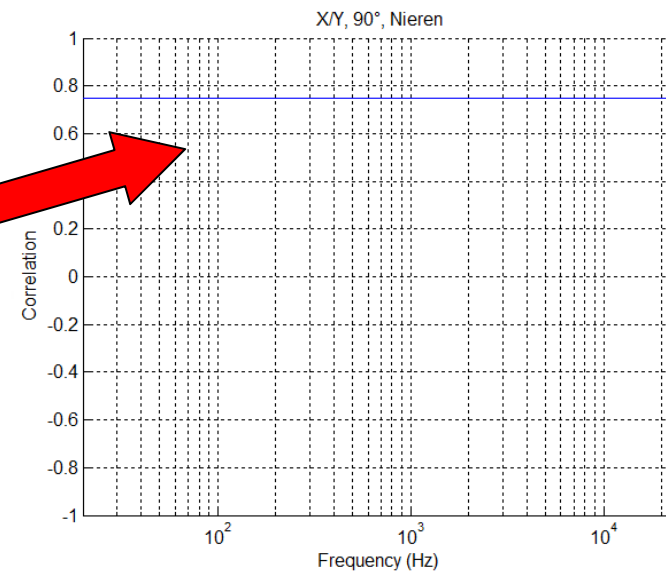

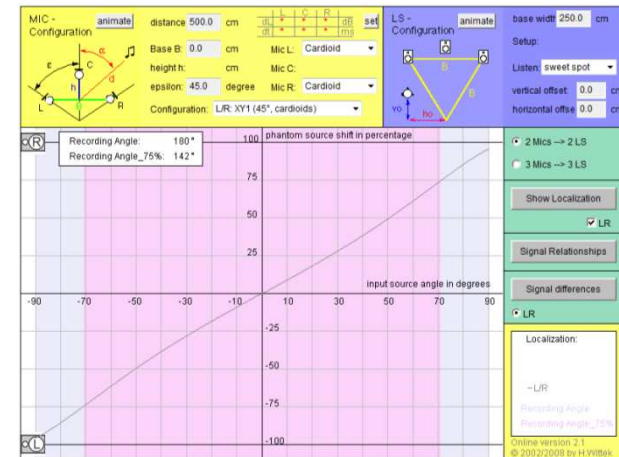

Ambience microphones for Stereo

Ambience microphones for Stereo

XY

- compact
- Cardioid XY has a large recording angle (180°), but a large DFC = 0.75
→ Room sounds boring
- Can be better with supercardioids

M/S

- compact
- flexible
- good room and imaging properties if decoded properly
- DFC can be 0
- Can be used on the boom with M = supercardioid or shotgun
- With M = Omni or wide cardioid a „full“ sound is possible

Postpro!

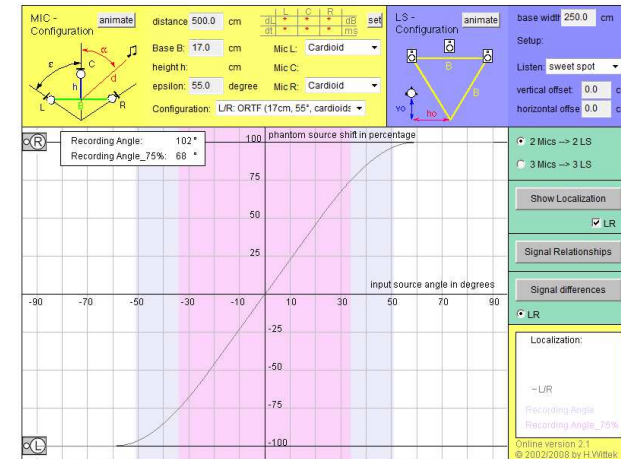

Ambience microphones for Stereo

ORTF

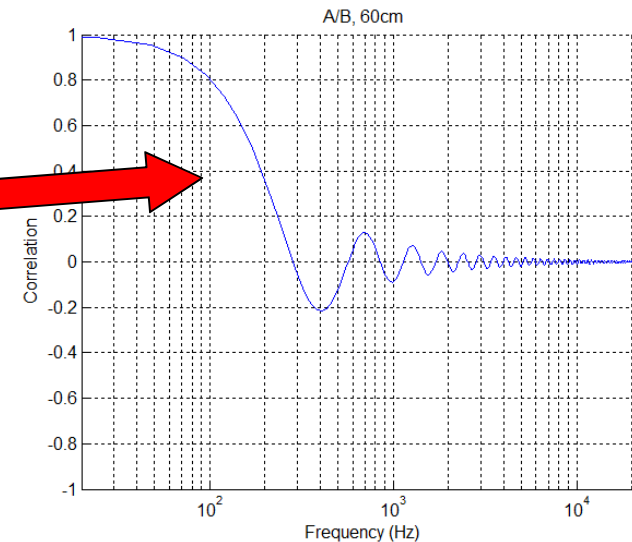

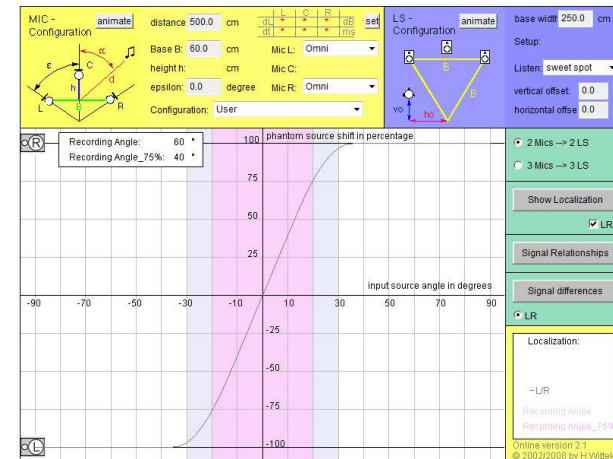

- relatively compact
- Very good imaging
- Open and nice room sound

Room+Imaging

A/B

- Not compact, $d \geq 40$ cm
- Often preferred sound colour
- Open and very nice room sound
- Average imaging quality
- Low wind sensitivity of the omnis, a foam windshield is often sufficient

Ambience microphones for

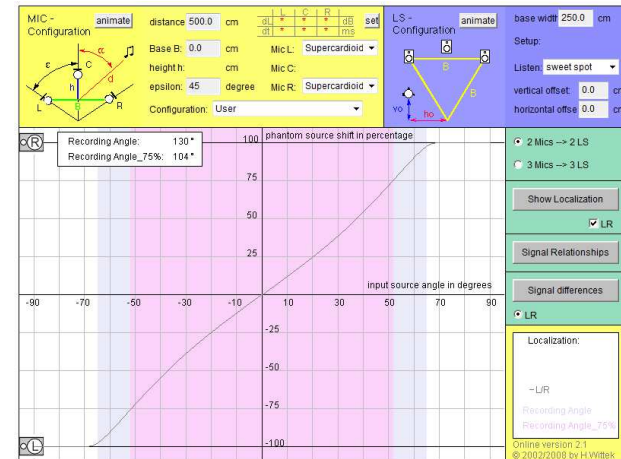

Surround

Ambience microphones for Surround

Double M/S

- Compact, flexible and practical
- Only 3 channels for Surround
- Decoding with 2 * M/S-Matrix, Hardware decoder or Plug-in
- High DFC if more than 3 output channels are used; maximum 4 Outputs are feasible
- If decoded properly:
 - Average room properties
 - Good sound colour; good imaging properties

Double M/S with shotgun

- Using a shotgun for the Centre channel: ideal setup for documentary
- Compact: Surround setup with windshield not larger than for Mono
- flexible und practical
- If decoded properly, good spatial properties
- Only 3 channels for Surround: shotgun, Fig-8, Cardioid
- Simple decoding with 2 normal M/S-Matrices

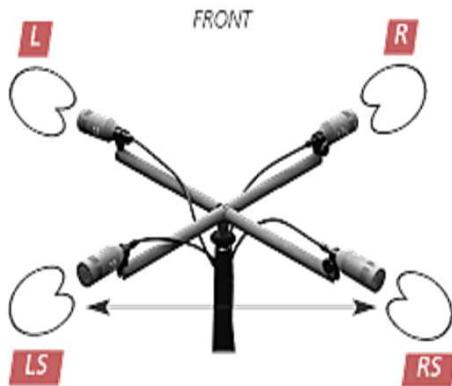

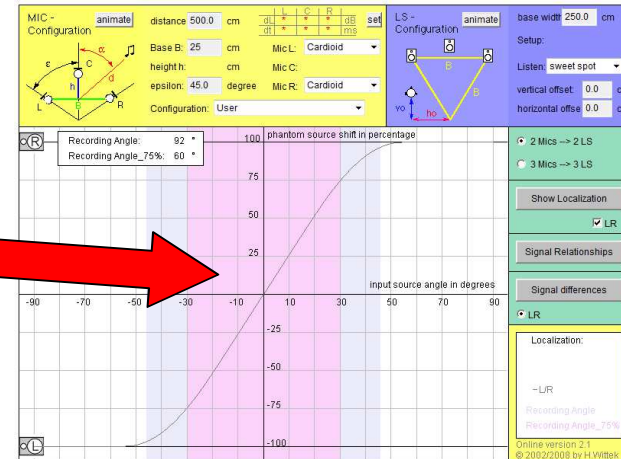

Compact!

IRT Cross

- Open room sound, very good 360°-Imaging
- Basis spacing:
 - 4 cardioids: 25cm
 - 4 supercardioids: 18cm
 - 4 wide cardioids: 31cm

360°
Imaging

ORTF Surround

- 4 Supercardioids, 10cm/100°+ 20cm/80°
- Compact and practical
- Open room sound + ideal 360°-Imaging (same as the IRT cross)
- **Plug&Play:** special windshield, suspension, Multicore mit Multipin-Plug

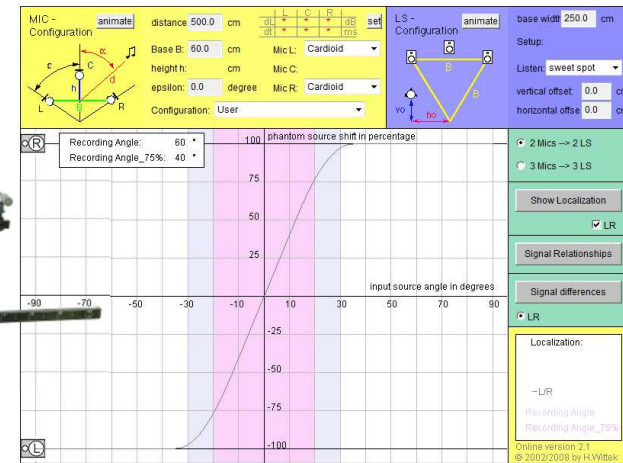

Theile trapezoid

- Room microphone for Front-Back-Scenario; not for Layer 3, ideal for layers 1 und 2
- 4 cardioids, facing backwards; $d = 60\text{ cm}$
- Optimal attenuation of direct sound from 0°

Audience microphone

Theile trapezoid

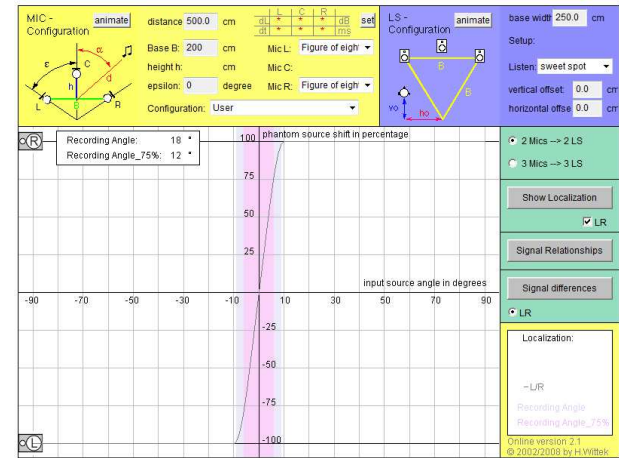

Photos: R. Bihler, SWR

Ambience microphones for Surround

Hamasaki Square

- Room microphone; L  \longleftrightarrow $> 2\text{ m}$  R
- not suitable for Layer 3-Signals, ideal for Layer 1 and Layer 2
- Extremely large spacing, not handy
- Open room sound, extremely low DFC
- Large attenuation of direct sound from 0° !
- Optimal reproduction of early lateral reflections

DFC = 0!

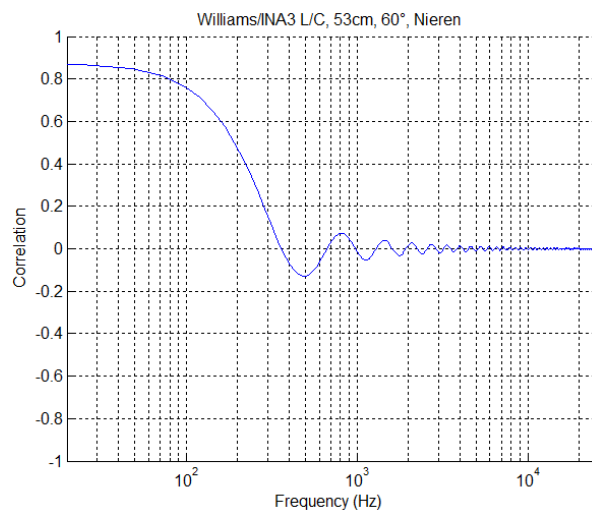

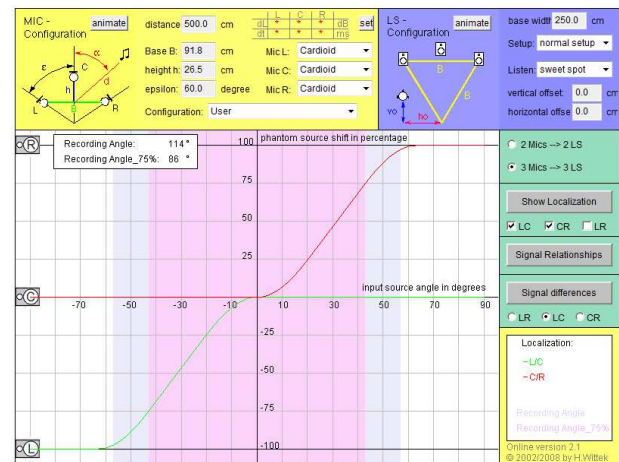

Figures for the pair L/Ls; d=200 cm

5ch – Equivalence setup after Williams/Theile/Wittek

- With Centre channel
- Geometry is calculated after e.g. Williams MMAD, INA or „Image Assistant“
- With normal, open or wide cardioids
- Very good sound colour
- Very good room and imaging properties
- Not compact; needs large spacings and single windshields

Stabile
360°
Abbildung,
toller Klang

Figures for „INA 3“

5ch – Equivalence setup after Williams/Theile/Wittek

Williams „Umbrella“: flexible Suspension

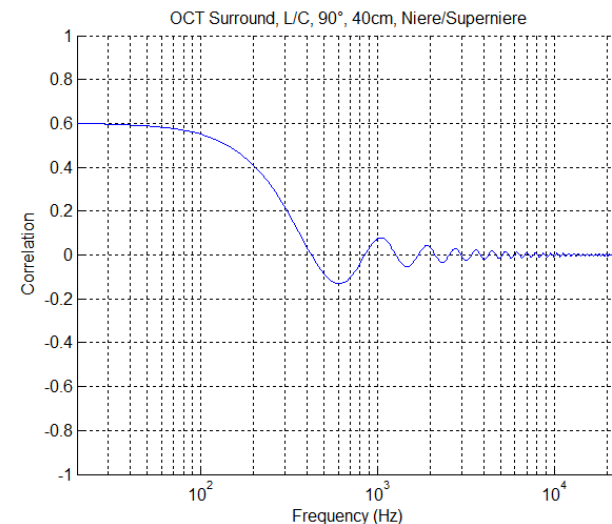

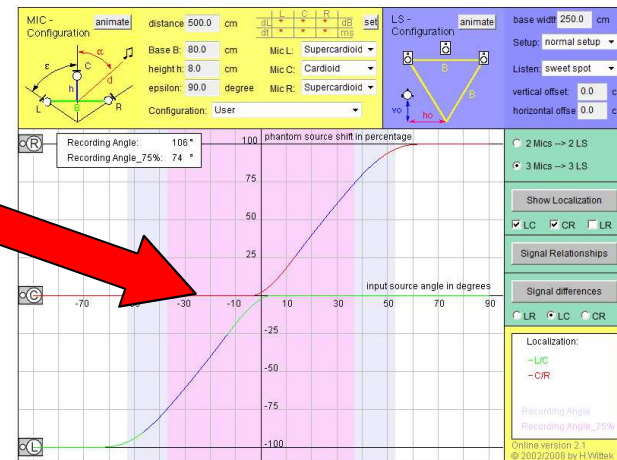

Ambience microphones for Surround

OCT Surround

- Ideal for Front-Back-Scene (Layer 3 only in front)
- Very natural room and imaging properties
- Not compact
- Good sound colour
- Optimal attenuation of Crosstalk → large stability of the image
- More Flexible:
OCT + Hamasaki Square

Ideal for Front/Back-Scene

Figures for the pair L/C and C/R

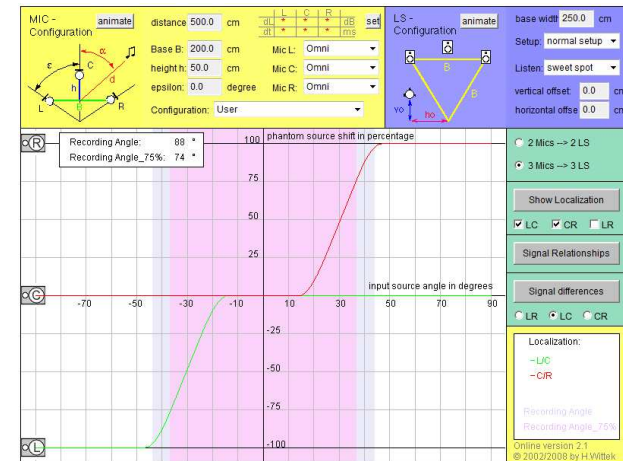

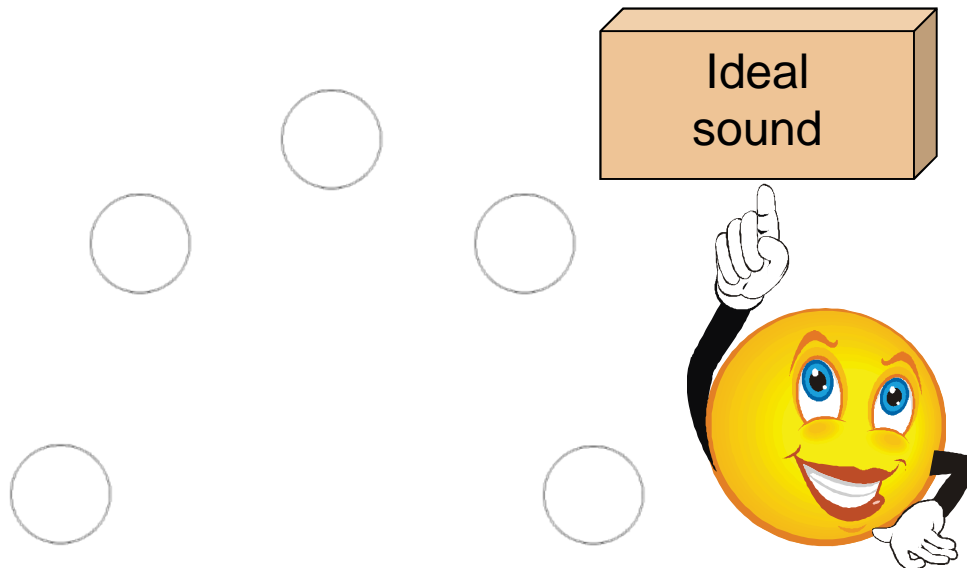

OCT Surround

Ambience microphones for Surround

Omni setup

- Very large, not compact
- Uses Omnis → often preferred sound colour
- Very good room properties
- Average imaging properties, yet stable

Figures for L/C=111 cm

Practice: Sports

Soccer: ORTF in the curve

*Soccer World Cup:
Double M/S and ORTF Surround*

Practice: Film

Double M/S with shotgun (A. Zacher)

IRT Cross

The screenshot shows a web browser window with the URL atmo.hauptmikrofon.de. The website has a navigation bar with links for HOME, IMAGE ASSISTANT 2.1, and IMPRESSUM/IMPRINT. The main content area features a large header for 'hauptmikrofon.de' with the tagline 'forum on sound engineering'. Below this, there are several sections: 'Image Assistant' with a link to 'Image Assistant 2.1'; 'Main' with links to 'News', 'Helmut Wittek', and 'Günther Thele'; 'Topics' with a link to 'AES-42 White Paper'; 'Stereó' with links to 'Berlin ambience techniques', 'VDT-Seminar "Atmosaufnahme" (German)', 'ORF Surround techniques', 'Aura3D', and 'PPT: Microphone techniques for 3D-Audio (ICSA, 2011)'; and 'Ressources' with a link to 'The Binaural Sky'. The main article, 'Berlin Ambience techniques', is written by Administrator and dated July 2012. It describes a collection of 5 simultaneous recordings with 6 different ambience microphone setups. A 'Downloads' section lists: 'Detailed Description of Recording setups, venues and listening test (pdf, 3.4 MB)', 'Listening test questionnaire', and 'Audio-Samples (713 MB)'. A photo shows a group of people in a listening test session. At the bottom, there is a section for '5 ambience recordings'.
